7	fig2.jpg	 The image consists of four X-Y charts comparing data from Direct Numerical Simulation (DNS) with different values of d^+ (0.5, 2.0, and 16.0). The top left chart shows U^+ versus an unspecified variable, with a legend indicating the line styles for each d^+ value. The top right chart is a close-up of the top left chart, focusing on the range from 150 to 550 on the x-axis. The bottom left chart displays k^+ versus y^+, and the bottom right chart is a close-up of the bottom left chart, focusing on the range from 0 to 50 on the x-axis. Each chart includes square markers representing DNS data. 7	fig1.jpg	 Diagram of a rectangular flow domain with solid walls on the top and bottom. The left side is labeled "Periodic Inflow" and the right side "Periodic Outflow," both with dashed lines. The height is marked as $2H$ and the length as L.	Diagram of a rectangular flow domain with solid walls on the top and bottom. The left side is labeled "Periodic Inflow" and the right side "Periodic Outflow," both with dashed lines. The height is marked as $2H$ and the length as L.
8	fig1.jpg	 Diagram of a flow channel with labeled dimensions and boundaries. The channel has an inflow on the left side measuring $8h$ in height and an outflow on the right side measuring $9h$ in height. The channel length is divided into three sections: $20h$, $110h$, and $50h$. The top boundary is marked as "Symmetry" with a dashed line, while the bottom boundary is labeled "Solid Wall." A step in the solid wall is shown with a height of h.	Diagram of a flow channel with labeled dimensions and boundaries. 9	fig2.jpg		The image consists of eight X-Y charts arranged in two rows. The top row shows four graphs plotting (y/h) against (U/U_{∞}), with curves and data points indicating a trend that rises sharply. The bottom row displays four graphs plotting (y/h) against (k), with curves and data points showing a sharp initial rise followed by a decline. Each graph features a blue line and orange square markers, illustrating data comparisons. Axes are labeled, and the charts depict variations in the plotted variables.
9	fig1.jpg		Two X-Y charts are displayed side by side. The left chart plots (C_f) against (x/h), showing a curve with a sharp dip and recovery, overlaid with experimental data points as orange squares. The right chart plots (C_p) against (x/h), featuring a similar pattern with a dip and rise, also overlaid with orange squares. A legend indicates that the orange squares represent experimental data, while the blue line represents a model with $(d^+ = 2.0)$. Both charts have axes labeled with scientific notation.
