2	fig1.jpg		Diagram illustrating a braking system. On the left, a brake disc is flanked by two brake pads with arrows indicating force applied towards the disc. On the right, a wheel is shown with brake blocks applying force, labeled as F_n, against the wheel. An arrow labeled V indicates the direction of wheel rotation.
4	fig1.jpg		A 3D plot showing a mesh model of a circular structure with a raised, segmented section on top. The base is a yellow ring with a grid pattern, while the raised section is blue and features cylindrical supports. The model appears to represent a mechanical or structural component, highlighting its geometric and spatial configuration.
5	fig1.jpg		Diagram of a mechanical testing setup within an ambient chamber. The setup includes a DC motor, flywheels, a brake disc and pad with sensors, and an electricity and pneumatic supply. A control system is shown on a desk with a computer and chair, indicating monitoring capabilities.
5	fig2.jpg		Diagram of a circular object with three labeled points: T1, T2, and T3. The circle has a diameter of 247.5 mm, with T1 positioned 30 mm from the center. T2 and T3 are each 40 mm from the center along the circumference. Below, a side view shows the points aligned horizontally on a 3 mm thick section.

6	fig1.jpg		Line chart showing the relationship between Degrees of Freedom (DOF) on the x-axis and Temperature in degrees Celsius on the y-axis. The chart displays data points at various DOF values, with temperatures increasing from 81°C to 147°C. The line connects these points, indicating a trend. A legend notes "Average temperature at point 1."
7	fig1.jpg		Line chart showing the average temperature at point 1 over time steps in seconds. The x-axis represents time steps on a logarithmic scale, and the y-axis represents temperature in degrees Celsius. Key data points are labeled: 146°C, 148°C, 130°C, and 209°C. The chart indicates fluctuations in temperature, with a significant rise at the end.
7	fig2.jpg		Line graph showing temperature in degrees Celsius over time in seconds. Two data series are plotted: "Experiment" in blue with diamond markers, and "Simulation" in orange with circle markers. Both series start around 60°C, rise sharply, and then level off around 200°C. The "Experiment" series shows more fluctuation compared to the "Simulation" series. A legend identifies the series.
8	fig2.jpg		Line graph showing temperature in degrees Celsius over time in seconds. Four lines represent different conditions: "Experiment" with blue diamonds, "contact=0.2" with orange circles, "contact=0.5" with green squares, and "contact=1.0" with red triangles. The graph illustrates

Page no	Fig/Photo	Thumbnail	Alt-text Description
			varying temperature trends for each condition, with the "contact=0.2" line peaking highest and declining sharply, while others show more gradual changes.
8	fig1.jpg		Line graph showing temperature in degrees Celsius over time in seconds. Four lines represent different conditions: "Experiment" with blue diamonds, "contact area=0.2" with orange circles, "contact area=0.5" with green squares, and "contact area=1.0" with red triangles. The graph indicates temperature increases rapidly initially, then levels off. A legend identifies each line.
